Gen. Microbiol. 112:697-705(1986).

- CATALYTIC ACTIVITY: D-altronate + NAD(+) = D-tagaturonate + NADH.

- PATHWAY: Glucuronate pathway.

- INDUCTION: BY GALACTURONATE, TAGATURONATE AND FRUCTURONATE. ITS

EXPRESSION IS SUBJECTED TO CATABOLITE REPRESSION BY GLUCOSE.

- SIMILARITY: SOME, TO THE MANNITOL DEHYDROGENASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        "Genome sequence of enterohaemorrhagic Escherichia coli O157:H7.";

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

culturing its gene-transformed host cells, useful for producing L-sorbose or 2-keto-L-gluconic acid as an intermediate in L-ascorbic acid production obtainable derived D-sorbitol dehydrogenase oxydans Gluconobacter

9; Page 60-63; 72pp; Japanese Claim The invention relates to Gluconobacter oxydans D-sorbitol dehydrogenase (SLDH; AAB21172) and to the gene encoding it (AAA97430). SLDH has a molecular weight of about 54 kba and catalyses the conversion of D-sorbitol into L-sorbose using NADP+ as a co-enzyme. SLDH specifically catalyses the oxidation of sorbitol, mannitol and arabitol, but does not encompasses expression vectors and placerol. The invention also encompasses expression vectors and host cells comprising the cluconobacter oxydans SLDH gene, and the recombinant production of SLDH. The invention further relates to a method for preparing L-sorbose by contacting the recombinant SLDH with D-sorbitol; a process for producing 2-keto-L-gluconic acid by contacting recombinantly produced sorbose dehydrogenase and/or sorbosone dehydrogenase with L-sorbose; and a process for preparing L-ascorbic acid or its alkaline earth metals salts by conversion from 2-keto-L- gluconic acid. SLDH is useful for producing L-sorbose or 2-keto-L- gluconic acid as an intermediate in L-ascorbic production. The present sequence represents the Gluconobacter SLDH gene. acid

This is a fragment of the regulatable expression vector, pWH332 which comprises two tet-operators ol and O2 and three tet-promoters A, R1 and R2, in addition to the tet A / cat gene fusion. It is used in the construction of the regulatable expression vectors pWH353 and pWH354 which comprise (a)the retracycline repressor gene (tetR): (b) a Bacillus adapted tetR-promoter sequence: (c) an adapted xylose-isomerase promoter sequence (xylp); and (d) at least one tet-operator sequence (tetO) between the consensus regions of proteins in Bacillus hosts. See also AAQ11698-700.
                                                                     Plasmid pWH332 fragment comprising tetracycline A/ cat gene fusion
                                                                                                                     Tetracycline repressor; tetR promoter; xylose-isomerase promoter;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Modified nitrilase gene (nit-23) carried on plasmid pBrx23 has 17 AAs cpUC19 replacing its 5' truncated terminus. It can be incorporated into E.coli or plants, providing protection from bromoxynil and related herbicides, and allowing decoxification of contaminated areas.

Tomato E8 promoter; transgenic fruit; ethylene production inhibition; S-adenosylmethionine hydrolase; delayed fruit ripening; ds.
                                                                                                                                                                                                                                                                               The sequence is a fragment of vector pUC19-SAM-K for expression of the Adometase gene. The gene is used to control ethylene biosynthes in plants. The enzyme hydrolyses S-adenosylmethionine to homoserine and 5'-methylthioadenosine (WTA). The presence of the gene and expression of the enzyme in plants lowers levels of Adomet, the sole precursor for ethylene biosynthesis, and its reduced availability causes a corresponding decrease in ethylene biosynthsis. The hydrolysis of Adomet by the enzyme generates MTA which is an inhibitor of 1-aminocyclopropane-1-carboxylic acid (ACC)synthase, a principle enzyme in the biosynthesis of ethylene. This results in fruit, vegetables and flowers which have improved shelf life and preservation qualities.
                                                                                                                                          Control of ethylene biosynthesis in plants - by introducing gene which encodes S-adenosyl methionine hydrolase activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Transgenic fruit-bearing plants, esp. tomato – contg. exogenous gene under control of E8 promoter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Bacteriophage T3 SAM-K modified S-adenosylmethionine hydrolase.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (i) a promoter for controlling exogenous gene transcription;
(ii) a reverse sequencing primer sequence;
(iii) an RBS (ribosome binding site) sequence and SD sequence;
(iv) a multiple cloning site directly downstream of the SD sequence;
(v) a positive sequencing primer sequence;
(vi) a terminator for controlling exogenous gene termination.
The multiple cloning site contains the enzymic incision site of a blunt end type restriction endonuclease, and the interval of SD-AUG is 5-8 multiple cloning, and the expression of exogenous genes in the molecular biology field.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents the nucleotide sequence of pJL6. The invention relates to methods for producing a vector containing the following
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                    AAQ78007 the tomato E8 gene promoter, and AAQ78008 which encodes AAR74824 the bacteriophage T3 derived SAM-K modified S-adenoslymethionine hydrolase (AdoMetase), were used in the construction of a vector. The vector was used to produce transgenic tomato plants which expressed AdoMetase under the translational control of the E8 promoter. AdoMetase is an inhibitor of ethylene production, and therefore an inhibitor of fruit ripening.

A synthetic double-stranded oligonucleotide linker has been used to introduce a eukaryotic translation initiation site for expression in transgenic plants. The SAM gene, which is involved in ethylene biosynthesis and fruit ripening, may be inserted in a vector under the control of a plant ripening or ethylene biosynthesis-inducible promoter (e.g. an E4 or E8 promoter, as in AAT09973) and introduced into e.g. tomato to produce a transgenic plant bearing fruit with altered fruit ripening phenotype, resulting from an initial burst of ethylene production

 The coding sequence of the phage T3 S-adenosylmethionine hydrolase gene was altered (AAT09964) so that the endoded enzyme, designated SAM-K (AAR88601), had an isoleucine to valine substin at position efficiency of the gene in plants. Transgenic raspberry and strawberry plants carrying the altered gene (see also AAT09967) were obtd. using a high-efficiency transformation and regeneration system. They, showed reduced levels of ethylene biosynthesis in leaf tissue

```
This sequence represents the AdoMetase gene derived from bacteriophage T3. This sequence may be used in the method of the invention to control ethylene biosynthesis in plants. This is done by transforming plant cells with a vector which contains a DNA sequence (I) allowing genetic selection in plant cells and a DNA sequence (II) allowing genetic selection in plant cells and a DNA sequence (II) encoding S-adenosylmethionine hydrolase (AdoMetase (AdoMetase) which hydrolyses S-adenosylmethionine (II) are flanked by regulatory elements that allow expression in plant cells. AdoMetase reduces levels of AdoMet, the essential precursor of ethylene (via 1-aminocyclopropane-1-carboxylic acid (ACC)) and MTA is an inhibitor of AcC synthase, the major enzyme involved in ethylene (synthasis. Transgenic plants containing this construct produce fruits, vegetables and flowers of improved shelf life and preservation qualities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A wide range of food and ornamental plants can be modified. The transgenic plants are able to control ethylene production under restricted conditions. This sequence has been modified around the

The present sequence is that of eukaryotic expression vector plasmid pcWn-McI. The plasmid is derived from pcWnbeta by replacing the Lac2 coding sequence with a linker containing multiple restriction sites. Modification of the human cytomegalovitus (CW) immediate early promoter was accomplished by substituting the sequence between SacI and the 2nd NotI site of pcMv-McI with a synthetic linker. North American porcine reproductive and respiratory syndrome (PRRS) virus P129A cDNA (see AAA27809) was cloned into the modified vector to create pcMv-S-P129 (ATCC 203489), which was used to demonstrate cellular expression of PRRS virus by direct transfection of cDNA into call a spanies. The invention relates to polynucleotide molecules, plasmids, viral vectors and transfected host cells that comprise North American
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New polynucleotide encoding an infectious RNA molecule of a North American porcine reproductive and respiratory syndrome virus for use a vaccine in protecting swine and other animals from infection by a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PRRS DNA. It also relates to polynucleotide molecules, viral vectors and transfected host cells encoding a genetically modified North American PRRS virus that is disabled in its ability to cause

Expression from the promoter is induced during fruit ripening optionally by ethylene synthesised in the fruit. The SAMase transgene produces fruit with reduced ethylene synthesis, delaying fruit ripening and lengthening storage periods. The present sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
